# Images and comments about ParkMe

This app offers an interactive map showing available parking spaces and their respective prices. When pressing the price bubble, it displays the place's information (location, availability, etc.). When searching for directions, it redirects to Google Maps, but this should be integrated into the app. Additionally, a payment system for reservations should be implemented.

Images and comments about wesmartPark
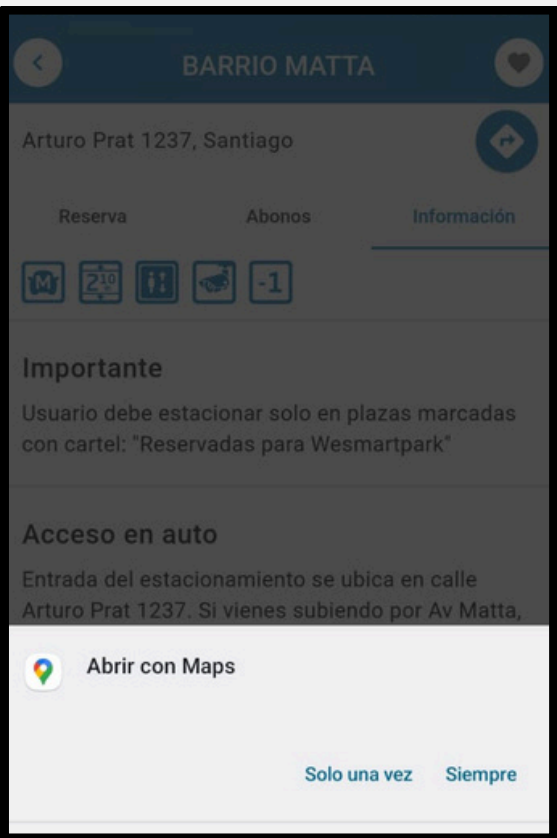

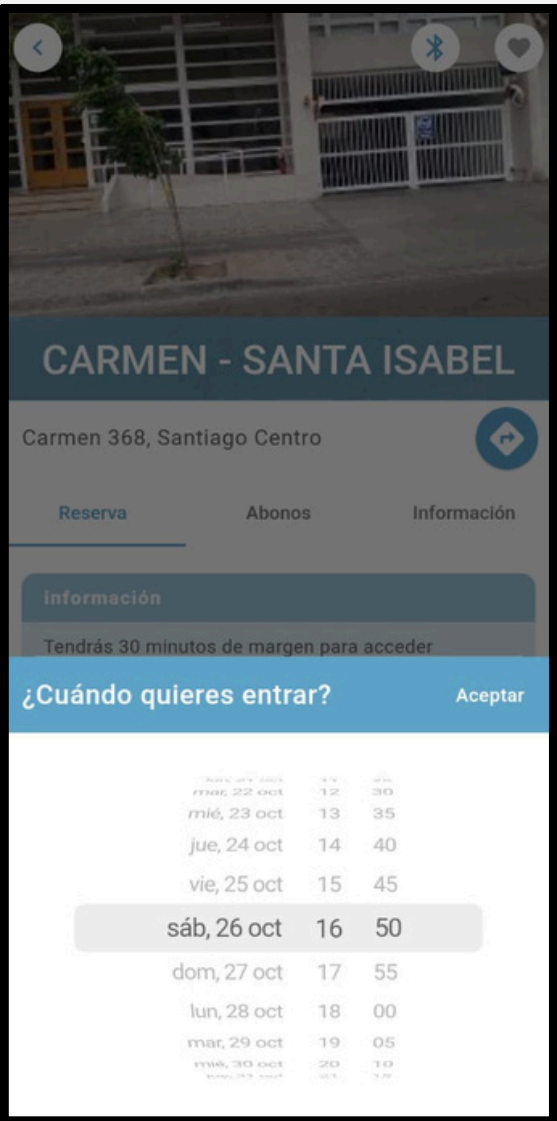

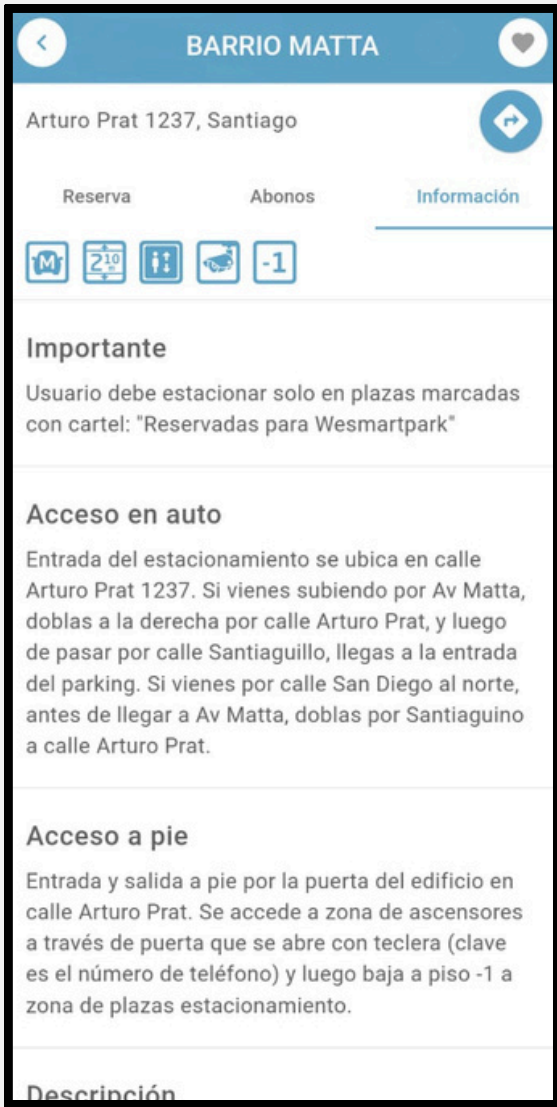

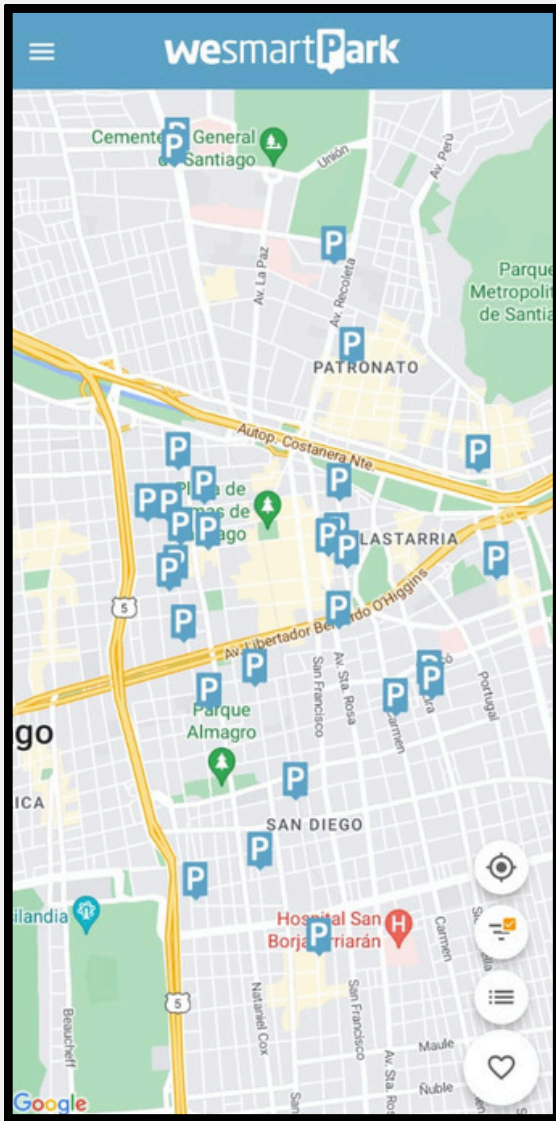

It offers an intuitive map with clearly marked parking locations and provides complete descriptions for each one. The reservation process is convenient. However, when selecting "how to get there," navigation opens in Google Maps instead of within the app.

Images and comments about ParkingApp
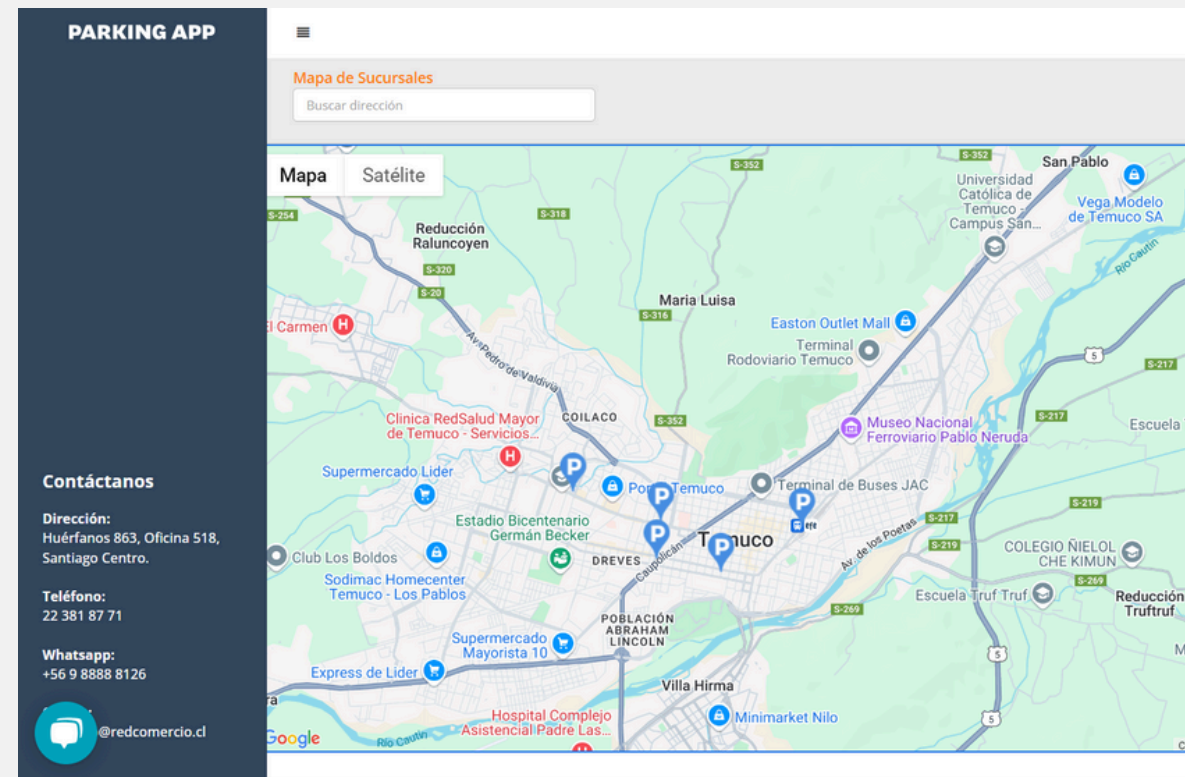

ParkingApp is a example of how our application can implement a system to keep track of the availability of a parking lot but at the same time how not to show the locations of these spots. Also it shows us the pisibility of using a system of patent registration for payment

Images and comments about JustPark
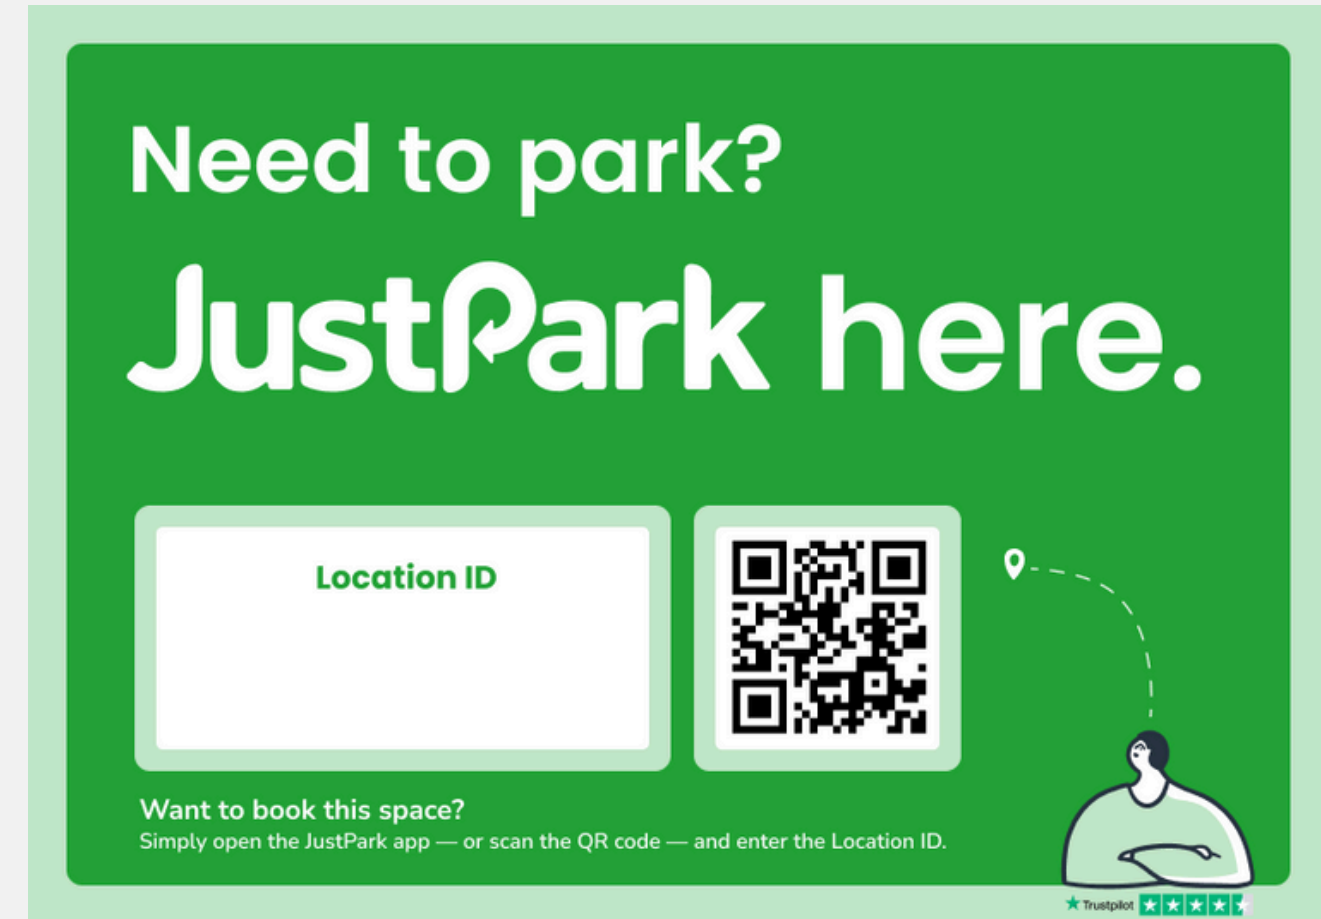

Our app can follow JustPark's example and add private driveway reservations. This would create new availability in congested areas and promote a community-driven model.
